> Summary. In this article, we define and develop differentiation of vectorvalued functions on $n$-dimensional real normed linear spaces (refer to [16] and [17]).

MML identifier: PDIFF_6, version: $\underline{7.11 .074 .146 .1112}$

The papers [8], [14], [2], [3], [4], [5], [13], [18], [1], [12], [6], [10], [15], [11], [9], [21], [19], [20], and [7] provide the terminology and notation for this paper.

1. The Basic Properties of Differentiation of Functions from $\mathcal{R}^{m}$ то $\mathcal{R}^{n}$

In this paper $i, n, m$ are elements of $\mathbb{N}$.
The following propositions are true:
(1) Let $f$ be a set. Then $f$ is a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$ if and only if $f$ is a partial function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$.
(2) Let $n, m$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}, g$ be a partial function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle, x$ be an element of $\mathcal{R}^{m}$, and $y$ be a point of $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$. Suppose $f=g$ and $x=y$. Then $f$ is differentiable in $x$ if and only if $g$ is differentiable in $y$.
(3) Let $n, m$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}, g$ be a partial function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle, x$ be an element of $\mathcal{R}^{m}$, and $y$ be a point of $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$. If $f=g$ and $x=y$ and $f$ is differentiable in $x$, then $f^{\prime}(x)=g^{\prime}(y)$.
(4) Let $f_{1}, f_{2}$ be partial functions from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$ and $g_{1}, g_{2}$ be partial functions from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$. If $f_{1}=g_{1}$ and $f_{2}=g_{2}$, then $f_{1}+f_{2}=g_{1}+g_{2}$.
(5) Let $f_{1}, f_{2}$ be partial functions from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$ and $g_{1}, g_{2}$ be partial functions from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$. If $f_{1}=g_{1}$ and $f_{2}=g_{2}$, then $f_{1}-f_{2}=g_{1}-g_{2}$.
(6) Let $f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}, g$ be a partial function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$, and $a$ be a real number. If $f=g$, then $a f=a g$.
(7) Let $f_{1}, f_{2}$ be functions from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$ and $g_{1}, g_{2}$ be points of the real norm space of bounded linear operators from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$. If $f_{1}=g_{1}$ and $f_{2}=g_{2}$, then $f_{1}+f_{2}=g_{1}+g_{2}$.
(8) Let $f_{1}, f_{2}$ be functions from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$ and $g_{1}, g_{2}$ be points of the real norm space of bounded linear operators from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$. If $f_{1}=g_{1}$ and $f_{2}=g_{2}$, then $f_{1}-f_{2}=g_{1}-g_{2}$.
(9) Let $f$ be a function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}, g$ be a point of the real norm space of bounded linear operators from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$, and $r$ be a real number. If $f=g$, then $r f=r \cdot g$.
(10) Let $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $x$ be an element of $\mathcal{R}^{m}$. Suppose $f$ is differentiable in $x$. Then $f^{\prime}(x)$ is a point of the real norm space of bounded linear operators from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$.
Let $n, m$ be natural numbers and let $I_{1}$ be a function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$. We say that $I_{1}$ is additive if and only if:
(Def. 1) For all elements $x, y$ of $\mathcal{R}^{m}$ holds $I_{1}(x+y)=I_{1}(x)+I_{1}(y)$.
We say that $I_{1}$ is homogeneous if and only if:
(Def. 2) For every element $x$ of $\mathcal{R}^{m}$ and for every real number $r$ holds $I_{1}(r \cdot x)=$ $r \cdot I_{1}(x)$.
The following three propositions are true:
(11) For every function $I_{1}$ from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$ such that $I_{1}$ is additive holds $I_{1}(\langle\underbrace{0, \ldots, 0}_{m}\rangle)=\langle\underbrace{0, \ldots, 0}_{n}\rangle$.
(12) Let $f$ be a function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$ and $g$ be a function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$. If $f=g$, then $f$ is additive iff $g$ is additive.
(13) Let $f$ be a function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$ and $g$ be a function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$. If $f=g$, then $f$ is homogeneous iff $g$ is homogeneous.

Let $n, m$ be natural numbers. One can verify that the function $\mathcal{R}^{m} \longmapsto$ $\langle\underbrace{0, \ldots, 0}\rangle$ is additive and homogeneous.

Let $n, m$ be natural numbers. Note that there exists a function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$ which is additive and homogeneous.

Let $m, n$ be natural numbers. A linear operator from $m$ into $n$ is defined by an additive homogeneous function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$.

We now state the proposition
(14) Let $f$ be a set. Then $f$ is a linear operator from $m$ into $n$ if and only if $f$ is a linear operator from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$.
Let $m, n$ be natural numbers, let $I_{1}$ be a function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$, and let $x$ be an element of $\mathcal{R}^{m}$. Then $I_{1}(x)$ is an element of $\mathcal{R}^{n}$.

Let $m, n$ be natural numbers and let $I_{1}$ be a function from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$. We say that $I_{1}$ is bounded if and only if:
(Def. 3) There exists a real number $K$ such that $0 \leq K$ and for every element $x$ of $\mathcal{R}^{m}$ holds $\left|I_{1}(x)\right| \leq K \cdot|x|$.
Next we state three propositions:
(15) Let $x_{1}, y_{1}$ be finite sequences of elements of $\mathcal{R}^{m}$. Suppose len $x_{1}=$ len $y_{1}+1$ and $x_{1} \upharpoonright$ len $y_{1}=y_{1}$. Then there exists an element $v$ of $\mathcal{R}^{m}$ such that $v=x_{1}\left(\operatorname{len} x_{1}\right)$ and $\sum x_{1}=\sum y_{1}+v$.
(16) Let $f$ be a linear operator from $m$ into $n, x_{1}$ be a finite sequence of elements of $\mathcal{R}^{m}$, and $y_{1}$ be a finite sequence of elements of $\mathcal{R}^{n}$. Suppose len $x_{1}=\operatorname{len} y_{1}$ and for every element $i$ of $\mathbb{N}$ such that $i \in \operatorname{dom} x_{1}$ holds $y_{1}(i)=f\left(x_{1}(i)\right)$. Then $\sum y_{1}=f\left(\sum x_{1}\right)$.
(17) Let $x_{1}$ be a finite sequence of elements of $\mathcal{R}^{m}$ and $y_{1}$ be a finite sequence of elements of $\mathbb{R}$. Suppose len $x_{1}=\operatorname{len} y_{1}$ and for every element $i$ of $\mathbb{N}$ such that $i \in \operatorname{dom} x_{1}$ there exists an element $v$ of $\mathcal{R}^{m}$ such that $v=x_{1}(i)$ and $y_{1}(i)=|v|$. Then $\left|\sum x_{1}\right| \leq \sum y_{1}$.
Let $m, n$ be natural numbers. Note that every linear operator from $m$ into $n$ is bounded.

Let us consider $m, n$. Observe that every linear operator from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$ is bounded.

Next we state several propositions:
(18) Let $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $x$ be an element of $\mathcal{R}^{m}$. Suppose $f$ is differentiable in $x$. Then $f^{\prime}(x)$ is a linear operator from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ into $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$.
(19) Let $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $x$ be an element of $\mathcal{R}^{m}$. Suppose $f$ is differentiable in $x$. Then $f^{\prime}(x)$ is a linear operator from $m$ into $n$.
(20) Let $n, m$ be non empty elements of $\mathbb{N}, g_{1}, g_{2}$ be partial functions from
$\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $y_{0}$ be an element of $\mathcal{R}^{m}$. Suppose $g_{1}$ is differentiable in $y_{0}$ and $g_{2}$ is differentiable in $y_{0}$. Then $g_{1}+g_{2}$ is differentiable in $y_{0}$ and $\left(g_{1}+g_{2}\right)^{\prime}\left(y_{0}\right)=g_{1}{ }^{\prime}\left(y_{0}\right)+g_{2}{ }^{\prime}\left(y_{0}\right)$.
(21) Let $n, m$ be non empty elements of $\mathbb{N}, g_{1}, g_{2}$ be partial functions from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $y_{0}$ be an element of $\mathcal{R}^{m}$. Suppose $g_{1}$ is differentiable in $y_{0}$ and $g_{2}$ is differentiable in $y_{0}$. Then $g_{1}-g_{2}$ is differentiable in $y_{0}$ and $\left(g_{1}-g_{2}\right)^{\prime}\left(y_{0}\right)=g_{1}{ }^{\prime}\left(y_{0}\right)-g_{2}{ }^{\prime}\left(y_{0}\right)$.
(22) Let $n, m$ be non empty elements of $\mathbb{N}, g$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, $y_{0}$ be an element of $\mathcal{R}^{m}$, and $r$ be a real number. Suppose $g$ is differentiable in $y_{0}$. Then $r g$ is differentiable in $y_{0}$ and $(r g)^{\prime}\left(y_{0}\right)=r g^{\prime}\left(y_{0}\right)$.
(23) Let $x_{0}$ be an element of $\mathcal{R}^{m}, y_{0}$ be a point of $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$, and $r$ be a real number. Suppose $x_{0}=y_{0}$. Then $\left\{y \in \mathcal{R}^{m}:\left|y-x_{0}\right|<r\right\}=\{z ; z$ ranges over points of $\left.\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle:\left\|z-y_{0}\right\|<r\right\}$.
(24) Let $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}, x_{0}$ be an element of $\mathcal{R}^{m}$, and $L, R$ be functions from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$. Suppose that
(i) $L$ is a linear operator from $m$ into $n$, and
(ii) there exists a real number $r_{0}$ such that $0<r_{0}$ and $\left\{y \in \mathcal{R}^{m}:\left|y-x_{0}\right|<\right.$ $\left.r_{0}\right\} \subseteq \operatorname{dom} f$ and for every real number $r$ such that $r>0$ there exists a real number $d$ such that $d>0$ and for every element $z$ of $\mathcal{R}^{m}$ and for every element $w$ of $\mathcal{R}^{n}$ such that $z \neq\langle\underbrace{0, \ldots, 0}_{m}\rangle$ and $|z|<d$ and $w=R(z)$ holds $|z|^{-1} \cdot|w|<r$ and for every element $x$ of $\mathcal{R}^{m}$ such that $\left|x-x_{0}\right|<r_{0}$ holds $f(x)-f\left(x_{0}\right)=L\left(x-x_{0}\right)+R\left(x-x_{0}\right)$. Then $f$ is differentiable in $x_{0}$ and $f^{\prime}\left(x_{0}\right)=L$.
(25) Let $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $x_{0}$ be an element of $\mathcal{R}^{m}$. Then $f$ is differentiable in $x_{0}$ if and only if there exists a real number $r_{0}$ such that $0<r_{0}$ and $\left\{y \in \mathcal{R}^{m}\right.$ : $\left.\left|y-x_{0}\right|<r_{0}\right\} \subseteq \operatorname{dom} f$ and there exist functions $L, R$ from $\mathcal{R}^{m}$ into $\mathcal{R}^{n}$ such that $L$ is a linear operator from $m$ into $n$ and for every real number $r$ such that $r>0$ there exists a real number $d$ such that $d>0$ and for every element $z$ of $\mathcal{R}^{m}$ and for every element $w$ of $\mathcal{R}^{n}$ such that $z \neq\langle\underbrace{0, \ldots, 0}_{m}\rangle$ and $|z|<d$ and $w=R(z)$ holds $|z|^{-1} \cdot|w|<r$ and for every element $x$ of $\mathcal{R}^{m}$ such that $\left|x-x_{0}\right|<r_{0}$ holds $f(x)-f\left(x_{0}\right)=L\left(x-x_{0}\right)+R\left(x-x_{0}\right)$.

## 2. Differentiation of Functions from Normed Linear Spaces $\mathcal{R}^{m}$ to Normed Linear Spaces $\mathcal{R}^{n}$

One can prove the following propositions:
(26) For all points $y_{2}, y_{3}$ of $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle \operatorname{holds}(\operatorname{Proj}(i, n))\left(y_{2}+y_{3}\right)=$ $(\operatorname{Proj}(i, n))\left(y_{2}\right)+(\operatorname{Proj}(i, n))\left(y_{3}\right)$.
(27) For every point $y_{2}$ of $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$ and for every real number $r$ holds $(\operatorname{Proj}(i, n))\left(r \cdot y_{2}\right)=r \cdot(\operatorname{Proj}(i, n))\left(y_{2}\right)$.
(28) Let $m, n$ be non empty elements of $\mathbb{N}, g$ be a partial function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle, x_{0}$ be a point of $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$, and $i$ be an element of $\mathbb{N}$. Suppose $1 \leq i \leq n$ and $g$ is differentiable in $x_{0}$. Then $\operatorname{Proj}(i, n) \cdot g$ is differentiable in $x_{0}$ and $\operatorname{Proj}(i, n) \cdot g^{\prime}\left(x_{0}\right)=(\operatorname{Proj}(i, n) \cdot g)^{\prime}\left(x_{0}\right)$.
(29) Let $m, n$ be non empty elements of $\mathbb{N}, g$ be a partial function from $\left\langle\mathcal{E}^{m}\right.$, $\|\cdot\|\rangle$ to $\left\langle\mathcal{E}^{n},\|\cdot\|\right\rangle$, and $x_{0}$ be a point of $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$. Then $g$ is differentiable in $x_{0}$ if and only if for every element $i$ of $\mathbb{N}$ such that $1 \leq i \leq n$ holds $\operatorname{Proj}(i, n) \cdot g$ is differentiable in $x_{0}$.

Let $X$ be a set, let $n, m$ be non empty elements of $\mathbb{N}$, and let $f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$. We say that $f$ is differentiable on $X$ if and only if:
(Def. 4) $\quad X \subseteq \operatorname{dom} f$ and for every element $x$ of $\mathcal{R}^{m}$ such that $x \in X$ holds $f \upharpoonright X$ is differentiable in $x$.

The following four propositions are true:
(30) Let $X$ be a set, $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $g$ be a partial function from $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ to $\left\langle\mathcal{E}^{n}\right.$, $\|\cdot\|\rangle$. Suppose $f=g$. Then $f$ is differentiable on $X$ if and only if $g$ is differentiable on $X$.
(31) Let $X$ be a set, $m, n$ be non empty elements of $\mathbb{N}$, and $f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$. If $f$ is differentiable on $X$, then $X$ is a subset of $\mathcal{R}^{m}$.
(32) Let $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $Z$ be a subset of $\mathcal{R}^{m}$. Given a subset $Z_{0}$ of $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ such that $Z=Z_{0}$ and $Z_{0}$ is open. Then $f$ is differentiable on $Z$ if and only if the following conditions are satisfied:
(i) $Z \subseteq \operatorname{dom} f$, and
(ii) for every element $x$ of $\mathcal{R}^{m}$ such that $x \in Z$ holds $f$ is differentiable in $x$.
(33) Let $m, n$ be non empty elements of $\mathbb{N}, f$ be a partial function from $\mathcal{R}^{m}$ to $\mathcal{R}^{n}$, and $Z$ be a subset of $\mathcal{R}^{m}$. Suppose $f$ is differentiable on $Z$. Then there exists a subset $Z_{0}$ of $\left\langle\mathcal{E}^{m},\|\cdot\|\right\rangle$ such that $Z=Z_{0}$ and $Z_{0}$ is open.
