(Received Nov. 18, 1965)

The aim of this paper is to study some properties of 4-sided skew polygon, and one sailent particular property of n-sided skew polygon.

1. 4-sided skew polygon

The 3-dimensional space expansion of CEVA's Theorem for 2-dimensional space is known as the following theorem.

Theorem. When four points $P_1, P_2, P_3, P_4$ are taken on four sides $A_1A_2, A_2A_3, A_3A_4, A_4A_1$ of 4-sided skew polygon respectively, the necessary and sufficient condition for these four points to be coplanar is

$$\frac{A_1P_1}{P_1A_2} \cdot \frac{A_2P_2}{P_2A_3} \cdot \frac{A_3P_3}{P_3A_4} \cdot \frac{A_4P_4}{P_4A_1} = 1,$$

where each expression with arrows represents a vector.

In this paper this theorem is to be constantly referred as 'The Expansion of CEVA's Theorem'.

The present writer deduced the following theorem from 'The Expansion of CEVA's Theorem'.

Theorem 1. Let $A_1A_2A_4: A_2A_3: A_3A_4$ in 4-sided skew polygon.

Let in the triangle $A_1A_2A_4$ the two intersecting points for the bisectors of two angles $A_1A_2A_4, A_2A_4A_1$ and for the two sides $A_1A_4, A_1A_2$ be $P_4, P_1$ respectively. Further, in the triangle $A_2A_3A_4$ the two intersecting points for the two bisectors of two angles $A_4A_2A_3, A_3A_4A_2$ and for the two sides $A_3A_4, A_2A_3$ be $A_3, A_2$ respectively. Then four points $P_3, P_2, P_3, P_4$ are coplanar.

Theorem 2. If in the 4-sided skew polygon $A_1A_2A_3A_4$, each inscribed circle of the triangles $A_1A_2A_4$ and $A_3A_4A_2$ contacts with the same point in side $A_2A_4$, then the other four points of contact are coplanar.

The above two theorems are easily deduced from 'The Expansion of CEVA's Theorem'.

2. n-sided skew polygon

In order to expand further 'The Expansion of CEVA's Theorem' for 4-sided
skew polygon to n-sided skew polygon, we will define as follows.

**Definition.** If in the n-sided skew polygon $A_1A_2 \cdots A_n$ in 3-dimensional space, n-2 triangles $A_nA_1A_2$, $A_nA_2A_3$, \ldots, $A_nA_{n-2}A_{n-1}$ construct different planes, the present writer will call this n-sided polygon *n-sided skew polygon*.

Now we get the following theorem.

**Theorem 3.** If some of n points $P_1$, $P_2$, \ldots, $P_n$ in n-sided skew polygon $A_1A_2A_3 \cdots A_n$ are taken on some sides of n sides $A_1A_2$, $A_2A_3$, \ldots, $A_{n-1}A_n$ the remaining points are taken on the productions of the remaining sides of the same polygon. Then the necessary and sufficient condition for these n points to be coplanar is

$$\frac{A_1P_1}{P_1A_2} \cdot \frac{A_2P_2}{P_2A_3} \cdot \frac{A_3P_3}{P_3A_4} \cdots \cdot \frac{A_nP_n}{P_nA_1} = 1.$$  

**Proof.** The present writer make us of the mathematical induction to proof the above Theorem 3.

(i). If $n=4$, then this theorem is evident from ‘The Expansion of Ceva’s Theorem’.

If $n=5$, then suppose that some of five points are taken on some sides of 5-sided skew polygon and the remaining points are taken on the remaining sides of the same polygon. Now suppose that such five points are in the same plane, then if the intersecting point of the plane $\pi$ and the line $A_4A_1$ is denoted by $\pi \cap A_4A_1 = X_1$, for the 4-sided skew polygon $A_1A_2A_3A_4$ we get

$$\frac{A_1P_1}{P_1A_2} \cdot \frac{A_2P_2}{P_2A_3} \cdot \frac{A_3P_3}{P_3A_4} \cdot \frac{A_4X_1}{X_1A_1} = 1.$$  

Since three points $P_4$, $P_3$, $X$ are coplanar, (1) using Menelaus’ Theorem deduces

$$\frac{A_1P_1}{P_1A_2} \cdot \frac{A_2P_2}{P_2A_3} \cdot \frac{A_3P_3}{P_3A_4} \cdot \frac{A_4X'}{X'A_1} = 1.$$  

Conversely, if (2) is satisfied it follows from the converse of Menelaus’ Theorem that such $X'$ as $\frac{A_1P_1}{P_1A_2} \cdot \frac{A_2P_2}{P_2A_3} \cdot \frac{A_3P_3}{P_3A_4} \cdot \frac{A_4X'}{X'A_1} = 1$ is on the line $A_4A_1$, and the three points $P_4$, $P_3$, $X'$ are coplanar.

We now say that four points $P_1$, $P_2$, $P_3$, $X'$ are coplanar from ‘The Expansion of Ceva’s Theorem’.

Let this plane be $\pi$, then since both $\pi$ and $\pi'$ have three points $P_1$, $P_2$, $P_3$ in common, $\pi' = \pi'$. Namely if (2) is satisfied, five points $P_1$, $P_2$, $P_3$, $P_4$, $P_5$ are coplanar.

(ii). Now suppose that in a r-sided skew polygon some of points $P_1$, $P_2$, \ldots, $P_n$
\(P_{r-1}, Y\) are on some of its \(r\)-sides \(A_1A_2, A_2A_3, \ldots, A_rA_1\), respectively, and the remaining points are on the production of its remaining sides.

Furthermore, suppose that the necessary and sufficient condition for such point to be coplanar is

\[
\frac{A_1P_1}{P_1A_2} \cdot \frac{A_2P_2}{P_2A_3} \cdot \ldots \cdot \frac{A_rY}{YA_1} = 1.
\]

If we denote the plane where the above points to be coplanar by \(\sigma\), then we obtain two points \(P_r, P_{r+1}\) such that

\[
\sigma \cap A_rA_{r+1} = P_r, \quad \sigma \cap A_{r+1}A_1 = P_{r+1}.
\]

Using Menelaus' Theorem the following is deduced from (3)

\[
\frac{A_1P_1}{P_1A_1} \cdot \frac{A_2P_2}{P_2A_2} \cdot \ldots \cdot \frac{A_rP_r}{P_rA_{r+1}} \cdot \frac{A_{r+1}P_{r+1}}{P_{r+1}A_1} = 1.
\]

Conversely, if (4) is satisfied it follows from the converse of Menelaus' Theorem that such \(Y\) as

\[
\frac{A_1P_1}{P_1A_2} \cdot \frac{A_2P_2}{P_2A_3} \cdot \ldots \cdot \frac{A_{r-1}P_{r-1}}{P_{r-1}A_r} \cdot \frac{A_rY}{YA_1} = 1
\]

is on the line \(A_rA_1\), and the three points \(P_r, P_{r+1}, Y\) are collinear, now since \(r\) points \(P_1, P_2, \ldots, P_{r-1}\), \(Y\) are coplanar, and that \(r+1\) points \(P_1, P_2, \ldots, P_r, P_{r+1}\) are coplanar. Therefore, if \(n=r+1\) still the theorem is held. Hence the proof of the theorem is concluded.
